

OpenOctopus

A Data and Engineering Collaboration Platform for
Manufacturing and the Sensor Industry Chain

Non-general AI Tooling · Sensor Entry Points · Industrial Infrastructure

Originating from defining inefficiencies on the manufacturing frontline

Why I Am Doing This

The starting point was not an AI topic, but a real industrial problem

UNCLEAR DEMAND

Key parameters misaligned, application scenarios vague

HARD-TO-UNDERSTAND PRODUCTS

Difficult sensor selection, highly variable spec interpretation

BROKEN VALIDATION CHAINS

Discontinuous test data, lack of evidence chain

LOW COLLABORATION EFFICIENCY

Engineering experience not codified, high communication costs

RE-AGGREGATING AND ORGANIZING INDUSTRIAL PROBLEMS

Problem-driven, not trend-driven

Integration of deep sensor field experience + German industrial scenario knowledge

Sensors are data entry points, not just small components.

Why Sensors Are a Major Opportunity

They are not just small components, but the data entry point of manufacturing.

Data Entry » **Execution** » **Optimization**

Data Entry Point

Execution Layer

Yield and Efficiency

Perception devices deployed at critical stations, high-end manufacturing lines.

AI Is a Tool, I = Industry

The real value comes from understanding operating conditions, parameters, scenarios, and delivery chains

AI Without Industry (I) AI

Stays at “Speaking”

Generative Q&A, Basic Models,
Lacks Engineering Insight

Lacks Engineering Validation

Simulation Fails, Parameter Shift,
Non-deployable Decisions

AI With Industry (I) AI

Moves to “Doing”

Engineering Analysis, Precise
Decisions, Optimized Paths

Can “Deliver”

Spec. Definition, Clarified
Requirements, Project Execution,
Deployment Operations

MIT (2024-11): Released “Intelligent Manufacturing Scenario Reference Guide (2024 Edition)” decomposed into 15 segments.

- “5G + Industrial Internet” covers all 41 categories, over 4000 5G factories.

Industry Pain Points & Consensus on Needs

Supply Side, Demand Side, and Delivery Side all face structural inefficiency

Supply Side

Fragmented Product Info & Spec Expression

Document Fragmentation/Non-standard

Difficult Precise Selection/Comparison

Quality Supply Overlooked

Demand Side

Non-standard conditions hard to convert to structured specs

Lack of Operating Conditions Description

Unstructured Requirements Expression

Selection relies entirely on experience

Delivery Side

Lack of end-to-end continuous engineering evidence chain

Data Silos

Test/MSA/DOE Disconnect

Release and delivery human-driven

Industrial Data & Engineering Scenarios

Core Missing Link: Industrial Data & Engineering Collaboration Hub

Disconnected Data, Specs, & Evidence Chain

Status: 15 Links, 40 Typical Scenarios
<Guideline for Typical Scenarios in Intelligent Manufacturing (2024)> MIIT

Widespread: Covers all 41 Major Industrial Categories
"5G+ Industrial Internet" MIIT

After Solution: R&D Cycle shortened 28.4% | Productivity increased 22.3%
National Demonstration Factory State Council/MIIT (2026-03)

What is Our Solution

Not an Isolated Tool, but a Continuous Loop

Only by accumulating real scenarios can it be transformed into a true moat

Our Data & Industry Moat

Accumulating real scenarios converts to a true moat

Sensor: Complex Scenarios, Sharp Breakthrough

Dual-Wheel Business Model

First target vendor side, then extend to demand and project sides.

Vendor-Side Business Model

1 Primary Revenue Stream

 Enterprise Subscriptions

 Listing & Exhibition

 Data Services

Platform Connectivity & Data Closed-Loop

Project-Side Growth Potential

2 Secondary Growth Stream

 Collaboration Tools

 Solution Services

 Brokering & Value-Add

Start: Supply Side   

Step 1: Vendor side builds supply density & data barriers

Then: Demand Side 

Step 2: Demand side expands usage depth

Next: Project Side  

Step 3: Project side evolves collaboration tools & value-add compounding

Business Model Strategy: First penetrate vendor side to build supply density & data barriers, then extend to demand and project sides.

Summary: Vendor side is the revenue starting point, project side is compounding potential.

Our Implementation Path

Start with a Narrow Focus, Then Build into a Platform

Execution is not about an abstract platform vision first, but following the sequence of integration, demand, project delivery, and platform leverage.

Start with a Narrow Focus, Then Build into a Platform

1. Step One

Prioritize acquiring sensor manufacturers

Establish high-quality supply-side data access

2. Step Two

Through specifications, engineering tools, and project workbenches

Undertake real demand scenarios

3. Step Three

Close the loop on every need, analysis, and delivery problems

Accrue each insight as platform assets

4. Step Four

Supply side, demand side, and project side mutual reinforcement

Gradually form composite value

Data Accumulation

Workflow Stickiness

Transaction Opportunities

Gradually Compounding Value

WHY US, WHY NOW?

REAL DATA, ENGINEER TEAM, WORKFLOW LOOP & CORRECT MARKET TIMING

THE ANSWER TO 'WHY US?': A UNIQUE COMBINATION OF REAL SCENARIO DATA, TEAM METHODOLOGY, WORKFLOW LOOP, AND STRATEGIC MARKET TIMING.

MOAT 1: EVOLVED FROM 30 YEARS OF INDUSTRIAL SCENARIO VALIDATION

FUNDING USAGE

- Improve Industry Data Foundation
- Refine Manufacturer-side and Project-side Product Closed Loop
- Promote Pilot Replication

Conclusion: The Complexity of the Sensor Industry Is the Entry Point for AI Value Creation

AI is the amplifier; Industry is the value body

- Building a data and collaboration foundation, not just tools
- Sensors are key to unlocking and rebuilding manufacturing
- AI amplifies value; Industry is the core asset
- Complexity is an entry point, not a barrier, for AI to create value
